Reasons for Allowance

The diastereomeric salts according to claims 7-10 of the instant application are novel. A method for producing optically active flurbiprofen comprising mixing racemic flurbiprofen and a chiral 3-methyl-2-phenylbutylamine and subsequently separating the resulting the diastereomeric salts is also novel (claims 1-6). Closest art (US 5,599,969) teaches preparation of phenylpropionic acids, which flurbiprofen is a member of, via resolution of diastereomeric salts. However, '969 uses α -methylbenzylamine or lysine as the chiral amine component of the salt, which are structurally different from 3-methyl-2-phenylbutylamine that is utilized in the instant invention. Substituting one amine for the other is not obvious and lacks motivation because it would affect the relative solubility of the diastereomeric salts and therefore the resolution of the two stereoisomers.
